

Testing

Wednesday, 15 May 2019 12:27 PM

Copy and paste any testing, validation, and/or usability testing here. Include a date, description of what was tested, and the outcome of testing with each entry.

I after creating an logo, I inserted it into my website. 10/06/2019

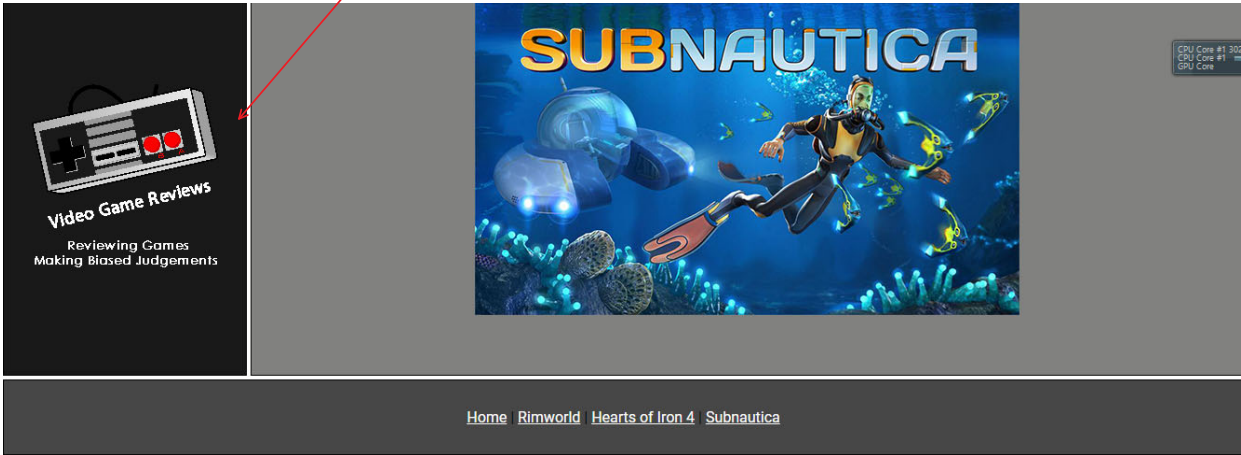

The Image was extremely skewed, and the text was not displaying correctly

To fix this I removed the height and width attributes to the images:

```
div class="box logo">  
  
</div>
```

This fixed the sizing issues and made the text on the logo readable

11/06/2019 After adding padding to the logo to even out the website, I found that the banner had created a grey strip along the bottom of the banner, whilst not critically breaking the website, this issue would create an aesthetical problem

along the bottom of the banner, whilst not critically breaking the website, this issue would create an aesthetic problem

To solve this problem I added an additional argument to the CSS

This argument ensures that the image covers 100% of the banner box

```
.banner_img {
  display: block;
  margin-left: auto;
  margin-right: auto;
  width: 100%;
  height: 100%;
}
```

Whilst technically stretching the image, this is barely noticeable, due to the size of the images, and the size of the grey space.

PEER REVIEW - 11/06/2019 14:16 PM

The first person that I asked to test my website had one main issue.

- Columns would shift between pages

To address the first problem I changed the sizes of the images in my website.

I forced the size of the images for the main grid

```
