

Copy snips of annotated before and after site improvements here.

Once I had completed my website, I changed my footer colour:

- Red colour was contrasting with the grey website.

From Red to Grey

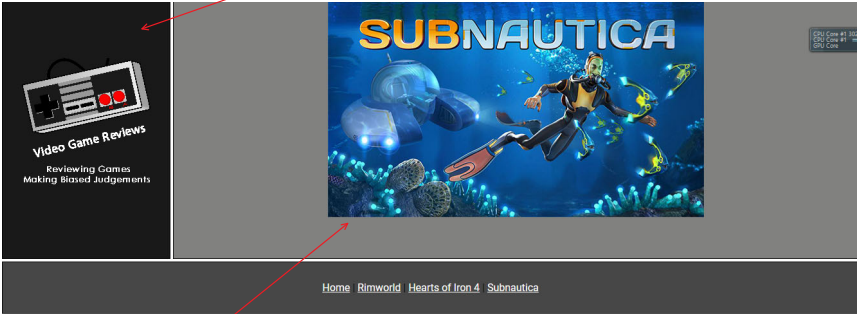

I have also changed the colour of the text to make it more readable.

I also changed the logo:

This improves the website, as it adds a description off the website on every page

The image had also become non centered

So I inserted this code to center the image

```
.banner img {  
  display: block;  
  margin-left: auto;  
  margin-right: auto;  
  width: 100%;  
}
```

This had however, increased the size of the image

v

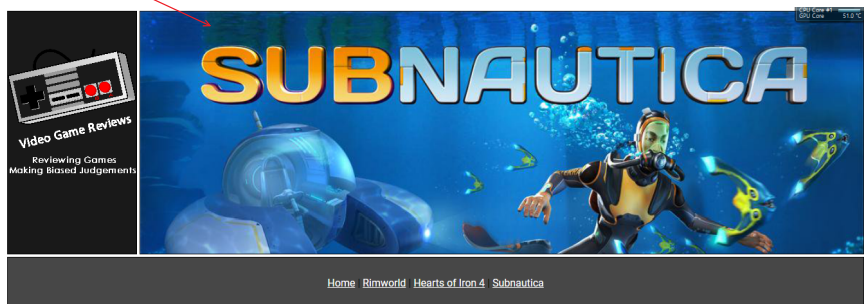

To solve this I added a height attribute to the html `img src="images/subnautica_banner.png" height="355"`

This almost solved the issue, and made sure that the banner image was the same height as all of the other pages

However, the image was not visually appealing, as it was stretched and low quality

To solve this I simply cropped the image

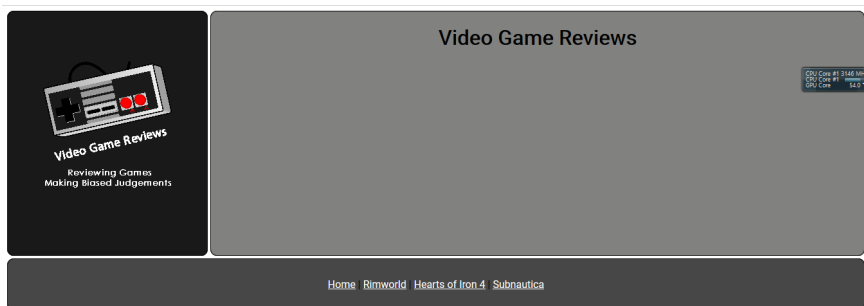

This allowed the image to not lose quality, and remain aesthetically pleasing. Whilst the image has been cropped, the main information in the banner has been compromised.

To give my website a more visually appealing look, I rounded the corners.

I did this by inserting this code `border-radius: 18px;`

This is the result:

The rounded corners give the website a much more appealing look, and removes harsh corners
